

PROJECT PROPOSAL & QUOTATION

ISCC Mass Balance Inventory Management System

A web-based system for tracking mass balance bookkeeping under ISCC EU and ISCC PLUS certification.

Quotation No.: QTN-2026-001

Date: 4 August 2026

Validity: 30 Days

Prepared for:

[Client Company Name]

Attention: [Client Name]

Prepared by:

Iqman Idzham

Solo Web Application Developer

Target launch: Week of September 14-21, 2026

1. Executive Summary

This proposal outlines a custom web application to replace manual, spreadsheet-based mass balance bookkeeping for biomethane and Bio-LNG under ISCC EU and ISCC PLUS certification. The system will track batches, transactions, and balancing periods, and will automatically enforce the compliance rules and ISCC audit checks so non-compliant entries are caught at the point of entry rather than discovered later.

The system will be delivered over approximately six weeks, with a working version covering the core compliance rules ready by the week of September 14-21, 2026.

2. Problem Statement

Mass balance bookkeeping under ISCC involves a number of rules that are easy to get wrong manually and costly to get wrong at audit time, including:

- Credits cannot be pooled across sites without explicit authorization.
- Balancing periods must run with no date gaps, and cannot exceed three months.
- Every inbound volume requires supporting physical documentation (e.g. a weighbridge ticket).
- Outgoing volume can never exceed what is actually available.
- Carry-forward rules differ by scheme.
- ISCC EU carry-forward is capped by physical stock on hand; ISCC PLUS is not.
- Merged batches must carry the worst-case (maximum) GHG value among their sources, not an average.
- Booked stock must reconcile with physical stock within a 0.5% tolerance.
- Certified volume may move from ISCC EU to ISCC PLUS, but never the reverse.

None of these are naturally enforced by a spreadsheet. The goal of this project is to make the compliant path the only path available to the user.

3. Proposed Solution

A web application with three core areas of functionality:

- **Data entry:** recording inbound, outbound, and conversion transactions, tied to physical documentation where required.
- **Automatic compliance validation:** every entry is checked against the applicable rules in real time, with a clear explanation whenever an entry is rejected.
- **Auditable period reporting:** each balancing period closes with a calculated, traceable balance, and every change made in the system is permanently logged.

4. Scope of Work

4.1 Included at Launch (Phase 1 & 2)

- **Core records:** Management of sites, batches, transactions, and physical documents.
- **Compliance rules:** Automated enforcement of site isolation, period continuity, physical document requirements, negative-balance prevention, carry-forward capping, GHG max-on-merge, and stock tolerance checks.
- **Roles:** Support for Trader and Processing Unit site types, with conversion tracking for Processing Units.
- **Cross-scheme transfer:** Capability for one-directional ISCC EU to ISCC PLUS volume transfers.
- **Audit trail:** Implementation of a permanent, append-only log of every change made in the system.
- **User Acceptance Testing (UAT):** A dedicated phase for the client to test the system and provide UI/UX feedback on usability before the final launch.

- **System testing and deployment:** Delivery of a deployed, working web application accessible online.

4.2 Deferred to Post-Launch (Phase 3 & Beyond)

The following features are explicitly excluded from this initial build and quotation, and will be discussed separately after the initial launch deadline:

- **Multi-tenant Client Portal:** Secure logins, isolated data views, and custom dashboards for external clients to log in and view their specific registered stock. (The current build is an internal company tool only).
- **Material Reference List:** Automated product-group matching (based on density, heating value, and RED category), replacing free-text material entry.

5. Technology

The system will be built using widely-supported, production-proven technology:

- **Backend:** Node.js (JavaScript/TypeScript) with Express.
- **Database:** MySQL 8.
- **Data layer:** Prisma ORM.
- **Frontend:** React.
- **Hosting:** Managed cloud hosting with automated backups.

6. Timeline & Milestones

Estimated Development Period: 6 Weeks

Phase	Dates	Milestone / Deliverable
Phase 1	Aug 4 - Aug 24, 2026	Core system: records, data entry, foundational compliance rules.
Phase 2	Aug 25 - Sep 6, 2026	Carry-forward, stock reconciliation, GHG merge logic, roles, conversions.
UAT & UI/UX	Sep 7 - Sep 13, 2026	Client usability testing and targeted UI/UX feedback on completed features.
Launch	Week of Sep 14-21, 2026	System live, covering all rules through cross-scheme transfer.

7. Project Cost & Support

Description	Amount
Custom ISCC Mass Balance Web Application <i>(Includes all Phase 1 & Phase 2 features detailed in Section 4.1)</i>	RM 4,000.00
Total Project Cost	RM 4,000.00

(Ringgit Malaysia Four Thousand Only)

3-Month Post-Handover Support

The project cost includes 3 months of post-handover support, which covers:

- Bug fixing related to the agreed project scope.
- Correction of technical issues within the delivered system.
- Minor system adjustments related to the agreed requirements.
- Basic technical assistance.

Note: Support does not include new features, major redesigns, or third-party integrations.

8. Payment Terms

Payment will be divided into two straightforward milestones to ensure continuous progress.

Payment	Amount	Condition
50% Deposit	RM 2,000.00	Must be paid within 3 days upon project confirmation and agreement by the client to commence development.
50% Final	RM 2,000.00	Upon project completion and final system handover.

9. Assumptions & Exclusions

- **Internal Tool Only:** The system is built for a single company/internal team to manage data. A multi-tenant platform for external clients is excluded from this phase.
- **UI/UX Testing Boundary:** UI/UX feedback during the UAT phase is limited to usability improvements on the agreed-upon features. Requests for new features or major workflow changes will be deferred to a post-launch phase.
- **Manual Entry:** Physical stock readings are entered manually; no sensor or IoT integration is included.
- **No External APIs:** No integration with external certification body systems is included.

10. Terms & Conditions

1. This quotation is valid for 30 days from the quotation date.
2. The project will be developed strictly according to the Phase 1 and Phase 2 scope outlined above. Any additional features outside the agreed scope may incur additional charges.
3. The client is responsible for providing necessary data, requirements, and materials required for development in a timely manner.
4. Third-party services, hosting, domain registration, server fees, software licenses, API fees, and other external service costs are excluded from the project cost.
5. **Limitation of Liability:** The web application is provided as a tool to assist with mass balance bookkeeping and rule verification under ISCC EU and ISCC PLUS certification. The client remains solely responsible for ensuring the accuracy of entered data, maintaining operational compliance, and successfully passing official certification audits. The developer shall not be held liable for audit failures, business losses, or regulatory penalties under any circumstances.

Acceptance

By signing below, the client agrees to the project scope, pricing, payment terms, and conditions stated above.
